

Heatmiser 2000L Control Panel

A Heatmiser 2000L temperature control allows you to keep your heating at the optimum level, no matter what the temperature is outside. And what's more, if zoned, you can set different times of the day and night.

Heatmiser is ideal for:

- Warehouses
- Offices
- Shops
- Factory Floor
- Storage Depots
- Churches
- Studios
- Schools

The key benefits of control panel are:

- Effective temperature
- Increased productivity from warm and happy staff
- Reduced wastage by keeping stock at exactly the right temperature
- Security coding prevents staff from adjusting the **Heatmiser** controls
- Ensures the temperature is just right at the start of every shift
- Whatever the temperature outside, **Heatmiser** automatically adjusts the temperature inside
- Keeps fuel costs down
- Installing a **Heatmiser** to bring the heating on during very cold weather can avoid damage due to frost and condensation
- The controls vary start up times in the morning to ensure that the building comes up to temperature by the required time
- Keeps heating just right – all day and all night!

Ensures right Temperature At Start of Work

Self-learning optimisation is a system whereby the **Heatmiser** control automatically calculates the turn on time to ensure the building is up to temperature for the programmed switching time.

Easily Programmed For Holiday Periods

The **Heatmiser** controls have up to 5 holiday periods, each of which can be programmed to allow for holiday breaks throughout the year.

Up to three switching periods per day

Each control can have up to four switching periods per day.

Easy to Read Illuminated Display

On selected models the display lights up for 5 minutes when any key is pressed, this makes the display easy to read even in poor lighting conditions.

Keep You Cool in Summer

Depending on the **Heatmiser** model and the heaters installed, the summer fan mode can be used to circulate cool air in warm weather under automatic or manual control.

Tamper Free

Security code prevents unauthorised tampering of the **Heatmiser** program settings.

Easy To Use Override Facility

Using the override button on the **Heatmiser** keypad allows the user to override the chosen zone for a selected number of hours. A maximum override time can be set to stop users entering long override periods.

User Friendly

Each control comes with a quick and simple to follow guide for day to day programming or simply set it and forget it!

Battery Backup

Should the mains supply fail, the battery backup will retain the programmed settings.

Day and Night Temperature Settings

Day and night temperature settings can be programmed into the **Heatmiser**. For example 21°C for when the building is occupied and 4°C to give frost protection, if required. Alternatively the second temperature setting can be used to maintain any required temperature.

7 Day Time Clock

All of the controls have a 7 day time clock which allows for individual time and temperature settings for each day of the week and each zone being controlled.

Weather Compensation

- This automatically adjusts the water temperature within the radiators in relation to weather conditions.
- The system operates at lower temperatures during milder weather, thus saving energy.
- It is a standard form of control in non-domestic buildings.
